Summary

Software engineer building production mobile applications with React Native and Expo. I design end-to-end backend integration and data synchronization for enterprise ERP applications, and my backend background (Spring Boot, .NET Core, PostgreSQL) lets me design the mobile and server sides together — as I've done on the products I've shipped on my own.

Experience

Mobile Application Developer , <i>Extreme BS</i> - Built two enterprise ERP mobile applications (warehouse/dispatch and receipt management) in production use across corporate clients, using React Native and Expo. - Wrapped an ERP protocol with inconsistent response shapes behind a single service layer, eliminating silent failures by detecting business-rule errors embedded in success responses. - Fixed a race condition in handheld barcode scanning with ref-based synchronous input handling; added a lock and focus retention to enable uninterrupted continuous scanning. - Turned quantity-overflow and off-order material errors from flow-breaking failures into a confirm-and-retry mechanism, removing repeated prompts with a per-shift "don't ask again" preference.	02/2026 – Present Remote
Software Engineering Intern , <i>Extreme BS</i> Developed production mobile applications with React Native and TypeScript; improved runtime stability by writing unit tests with Jest.	08/2025 – 09/2025
Software Engineering Intern , <i>iQuality</i> - Built a JWT-secured CRM REST API with Spring Boot 3, implementing endpoints for customer, agent, and ticket workflows. - Designed the PostgreSQL schema and automated version management with Flyway; containerized the service with Docker Compose and deployed it to production on Railway.	10/2025 – 11/2025

Products

translateyourpdf.com , <i>Python/FastAPI · Next.js</i> - Built a layout-preserving PDF translation engine; when translated text runs up to 40% longer, a six-tier fallback chain fits it into the original boxes without silently dropping any block. - Built an asynchronous job pipeline that streams results page by page, can be cancelled mid-run, and charges only for pages actually delivered. - Wrote the billing system — atomic credit reservation and payment webhooks made idempotent via a unique constraint — along with passwordless magic-link authentication.	
Randevai , <i>Spring Boot · Next.js · PostgreSQL/pgvector · Baileys</i> - Built an AI assistant that replies to WhatsApp messages on a business's behalf and books appointments; by never giving the LLM write access to the calendar and exposing only verified free slots, I eliminated hallucinated times and double bookings. - Designed a durable queue using SKIP LOCKED and claim-token leases, making duplicate sends impossible in bulk messaging. - Prevented the bot from inventing prices and hours with pgvector-based RAG, falling back to keyword search when the embedding service is unavailable.	

Technical Skills

Languages Java, C#, TypeScript, JavaScript, Go, Python	Backend Spring Boot, Spring Security, ASP.NET Core, Node.js
Mobile React Native, Expo, Flutter, Jest	Databases PostgreSQL, MySQL, Entity Framework, Flyway
Architecture Clean Architecture, Onion Architecture, Repository Pattern, REST API, JWT	Tools Docker, Docker Compose, Git, Postman, EAS Build

Projects

Classroom & Laboratory Management System - Built a REST API for university course and classroom scheduling following Clean Architecture and the Repository Pattern. - Implemented JWT-based authentication with role/permission management, plus complaint and fault-tracking modules.
Football Pitch Reservation System - Built an API shared by web and mobile clients, structured with Onion Architecture. - Implemented real-time reservation status updates and notification flows with SignalR.

Education

BSc in Computer Engineering , <i>Trakya University</i> GPA: 3.21/4.0	09/2021 – 06/2025 Edirne, Turkey
